

PART 1: UI Design

In the interface for the user, we have multiple components such as Login, Home, AboutUs, Contact, SoundMenu. I was wondering if the team in Valencia could work on suggesting the a design of the UI in order to make it more attractive to the user. Especially, the soundMenu component.

The soundMenu is used to add sound files to the media content of the user which can be later accessed by the project page. (The project page used in the “dashboard” UI)We can add soundfiles to the UI by using the “Add Sound File” button. (We haven’t implemented the backend to actually add the file to the database on the server-side. It only renders a new Card on the screen). I was hoping to receive suggestions on how the design here can be improved.

The link to the repository: <https://github.com/ameykpate/dashboad-UI>

To run the application.

1. Open the root directory on terminal
2. Run the command “npm install” and wait for the modules to load.
3. Run the command “npm start”
4. It will open the react application on your local host. You can now look at the current front-end and make suggestions.
